Outline

Model

Perceptrons as Universal Function Approximators

From Activations to Classifications: Softmax Function

Optimization

Layer Abstraction

Model

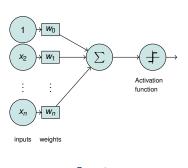

Recap: Perceptrons

Perceptron's decision rule:

$$\hat{y} = sign(\mathbf{w}^T \mathbf{x})$$

Classification only depends on sign of distance

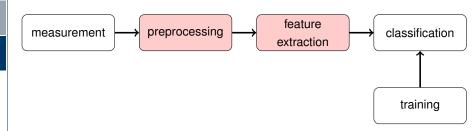

New sample Orthogonal distance $\alpha=90^{\circ}$ Decision boundary

Perceptron

Linear decision boundary

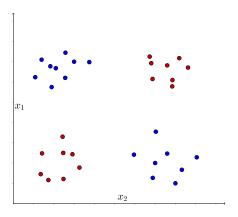

Recap: Pattern Recognition Pipeline

- (Multi-layer) perceptron (today's lecture) still uses predefined features
- "Hand-crafted" feature design is replaced by data driven feature learning in state-of-the-art architectures (upcoming lectures)
- Most concepts are important across architectures!

XOR Problem

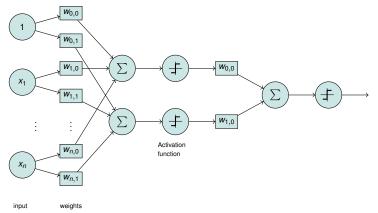

Samples from a XOR problem

- XOR can't be solved with a line
- 1969: "Perceptrons" described limitations of neural networks
- Al funding was cut heavily
- This became known as "Al winter"

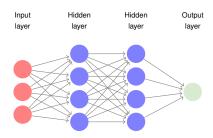

Multi-Layer Perceptron

- A perceptron resembles a single neuron
- Idea: Use multiple neurons!
- This enables non-linear decision boundaries

Terminology

- Terms: Input layer, hidden layers, output layer
- A single hidden layer (of arbitrary width) can already be shown to be a universal function approximator
- Non-linear functions
 - are called activation functions in hidden layers
 - predict in the output layer and are used for the loss function

Perceptrons as Universal Function Approximators

Universal Approximation Theorem

- Let $\varphi(\cdot)$ be a non-constant, bounded and monotonically increasing function.
- For any $\varepsilon > 0$ and any continuous function f defined on a compact subset of \mathbb{R}^m , there exist an integer N, real constants $v_i, b_i \in \mathbb{R}$ and real vectors $w_i \in \mathbb{R}^m$ where $i = 1, \ldots, N$, such that

$$F(\mathbf{x}) = \sum_{i=1}^{N} v_i \varphi(\mathbf{w}_i^T \mathbf{x} + b_i)$$
 with $|F(\mathbf{x}) - f(\mathbf{x})| < \varepsilon$

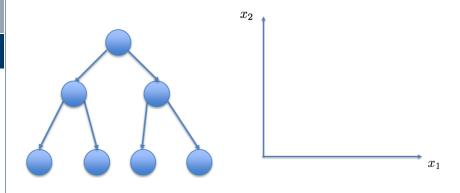

Universal Approximation Theorem

- Let $\varphi(\cdot)$ be a non-constant, bounded and monotonically increasing function.
- For any $\varepsilon > 0$ and any continuous function f defined on a compact subset of \mathbb{R}^m , there exist an integer N, real constants $v_i, b_i \in \mathbb{R}$ and real vectors $w_i \in \mathbb{R}^m$ where $i = 1, \dots, N$, such that

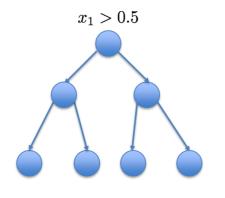

$$F(\mathbf{x}) = \sum_{i=1}^{N} v_i \varphi(\mathbf{w}_i^T \mathbf{x} + b_i)$$
 with $|F(\mathbf{x}) - f(\mathbf{x})| < \varepsilon$

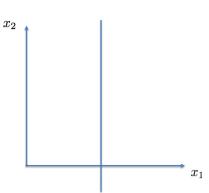

→ We can approximate any function with just one hidden layer with a sensible activation function.

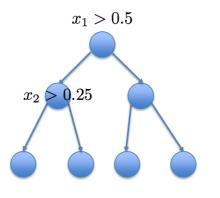

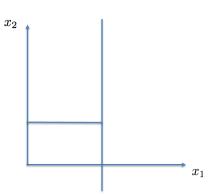

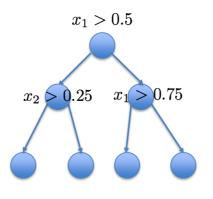

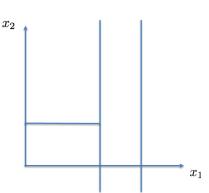

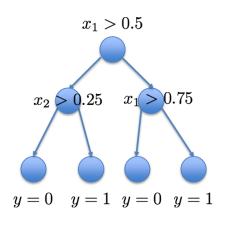

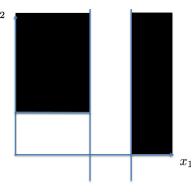

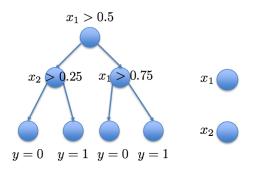

$$y = 1$$

$$y = 0$$

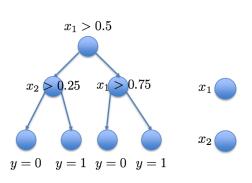

We can transform this into a network!

 x_1

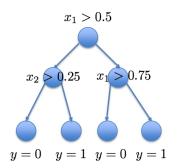

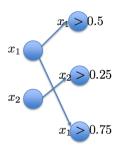

1

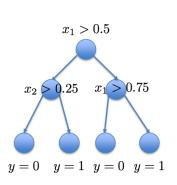

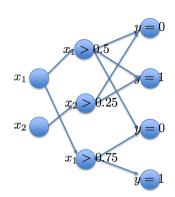

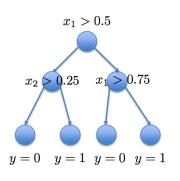

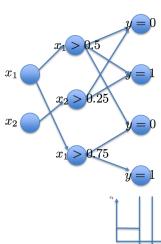

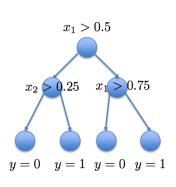

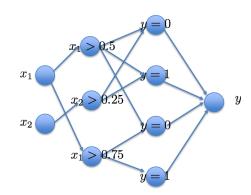

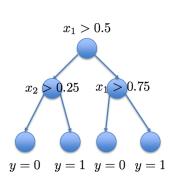

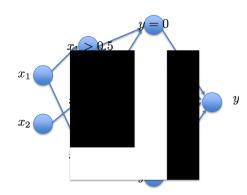

Universal Approximation Theorem

- Let $\varphi(\cdot)$ be a non-constant, bounded and monotonically increasing function.
- For any $\varepsilon > 0$ and any continuous function f defined on a compact subset of \mathbb{R}^m , there exist an integer N, real constants $v_i, b_i \in \mathbb{R}$ and real vectors $w_i \in \mathbb{R}^m$ where i = 1, ..., N, such that we can define:

$$F(\mathbf{x}) = \sum_{i=1}^{N} v_i \varphi(\mathbf{w}_i^T \mathbf{x} + b_i)$$
 with $|F(\mathbf{x}) - f(\mathbf{x})| < \varepsilon$

- → We can approximate any function with just one hidden layer with a sensible activation function.
- → We have no idea how: how many nodes, how to train, ...

From Activations to Classifications: Softmax Function

Terminology

- So far: ground truth/estimated label is described by $y/\hat{y} \in \{-1, 1\}$.
- Instead, we can use a vector $\mathbf{y} = (y_1, \dots, y_K)^T$ where K = # classes.
- For exclusive classes, y looks as follows:

$$y_k = \begin{cases} 1 & \text{if } k \text{ is the index of the true class,} \\ 0 & \text{otherwise} \end{cases}$$

- Called **one-hot encoding**: Only one element is $\neq 0$.
- Classifier output $\hat{\mathbf{v}}$ can represent class probabilities.
- Better descriptor, especially for multi-class problems!

• The softmax function rescales a vector **x** using:

$$\hat{y}_k = \frac{\exp(x_k)}{\sum_{j=1}^K \exp(x_j)}$$

- ŷ has two properties:
 - 1. $\sum_{k=1}^{K} \hat{y}_k = 1$
 - 2. $\hat{y}_k > 0 \quad \forall \hat{y}_k \in \hat{\mathbf{y}}$
- These are two of Kolmogorov's axioms for a probability distribution.
- This allows to treat the output as normalized probabilities.
- The softmax function is also known as the normalized exponential function.

• The softmax function rescales a vector **x** using:

$$\hat{y}_k = \frac{\exp(x_k)}{\sum_{j=1}^K \exp(x_j)}$$

Loss functions

The cross entropy H of probability distributions p and q

$$\mathsf{H}(\mathsf{p},\mathsf{q}) = -\sum_{k=1}^{K}
ho_k \log(q_k)$$

• Based on H, we formulate a loss function L:

$$L(\mathbf{y}, \hat{\mathbf{y}}) = -\log(\hat{y}_k)|_{y_k=1}$$

We will talk more about this during the next session!

"Softmax loss"

Cross-entropy and the Softmax function typically appear together

$$L(\mathbf{y}, \mathbf{x}) = -\log \left(\frac{\exp(x_k)}{\sum_{j=1}^K \exp(x_j)} \right) |_{y_k=1}$$

- One-hot encoding very convenient →represents a histogram
- Naturally handles multiple class problems

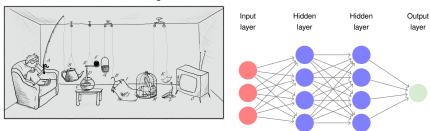

Optimization

Credit Assignment Problem

What do those two images have in common?

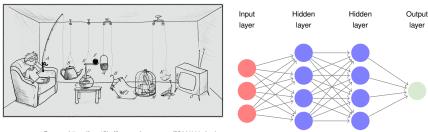

Source: https://krypt3ia.files.wordpress.com/2011/11/rube.jpg

Credit Assignment Problem

What do those two images have in common?

Source: https://krvpt3ia.files.wordpress.com/2011/11/rube.ipg

If it doesn't work it's hard to know which parts to adjust.

Formalization as Optimization Problem

Goal: Find optimal weights w for all layers:

Abstract the whole network as a function:

$$L(\mathbf{w}, \mathbf{x}, \mathbf{y})$$

Consider all M training samples:

$$\mathbb{E}_{\mathbf{x},\mathbf{y}\sim\hat{p}_{\mathrm{data}}(\mathbf{x},\mathbf{y})}\big[L(\mathbf{w},\mathbf{x},\mathbf{y})\big] = \frac{1}{M}\sum_{m=1}^{M}L(\mathbf{w},\mathbf{x},\mathbf{y})$$

• We now know what to do:

$$\underset{\mathbf{w}}{\text{minimize}} \quad \left\{ L(\mathbf{w}, \mathbf{x}, \mathbf{y}) \right\}$$

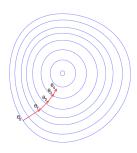

Gradient Descent

$$\underset{\mathbf{w}}{\operatorname{argmin}} \quad \left\{ \frac{1}{M} \sum_{m=1}^{M} L(\mathbf{w}, \mathbf{x}, \mathbf{y}) \right\}$$

- Method of choice: Gradient Descent
 - Initialize w
 - 2. Iterate until convergence:

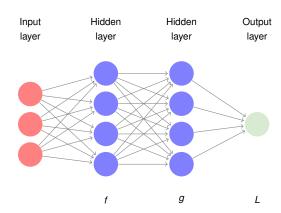

$$\mathbf{w}^{k+1} = \mathbf{w}^k - \eta \nabla_{\mathbf{w}} \frac{1}{M} \sum_{m=1}^{M} L(\mathbf{w}, \mathbf{x}, \mathbf{y})$$

3. η is commonly referred to as the **learning rate**

What is this L we are trying to optimize?

Complex network can be seen as composed functions:

$$L(\mathbf{w}, \mathbf{x}, \mathbf{y}) = L(g(f(\mathbf{x}, \mathbf{w}_f), \mathbf{w}_g), \mathbf{y})$$

THE FRIDAY OF THE PRINCIPLE OF THE PRINC

How to Calculate Derivatives in Complex Neural Networks?

Example Problem

- Function: $\hat{y} = f(\mathbf{x}) = (2x_1 + 3x_2)^2 + 3$
- Evaluate $\frac{\partial}{\partial x_1} f \begin{pmatrix} 1 \\ 3 \end{pmatrix}$

Two algorithms:

- Finite differences
- Analytic derivative

Finite Differences

Definition of derivative:

$$f'(x) = \lim_{h \to 0} \frac{f(x+h) - f(x)}{h}$$

Due to finite precision the symmetric definition is preferred:

$$f'(x) = \lim_{h \to 0} \frac{f(x + \frac{1}{2}h) - f(x - \frac{1}{2}h)}{h}$$

- Function: $\hat{y} = f(\mathbf{x}) = (2x_1 + 3x_2)^2 + 3$
- $f'(x) = \lim_{h \to 0} \frac{f(x + \frac{1}{2}h) f(x \frac{1}{2}h)}{h}$

• Evaluate $\frac{\partial}{\partial x_1} f \begin{pmatrix} 1 \\ 3 \end{pmatrix}$

Let's calculate it:

• Set h to $2 \cdot 10^{-2}$

$$\frac{\partial}{\partial x_1} f\begin{pmatrix}1\\3\end{pmatrix} = \frac{\left(\left(2\left(1+10^{-2}\right)+9\right)^2+3\right)-\left(\left(2\left(1-10^{-2}\right)+9\right)^2+3\right)}{2\cdot 10^{-2}}$$

- Function: $\hat{y} = f(\mathbf{x}) = (2x_1 + 3x_2)^2 + 3$
- $f'(x) = \lim_{h \to 0} \frac{f(x + \frac{1}{2}h) f(x \frac{1}{2}h)}{h}$

• Evaluate $\frac{\partial}{\partial x_1} f \begin{pmatrix} 1 \\ 3 \end{pmatrix}$

Let's calculate it:

• Set h to $2 \cdot 10^{-2}$

$$\frac{\partial}{\partial x_1} f \begin{pmatrix} 1 \\ 3 \end{pmatrix} = \frac{\left(\left(2 \left(1 + 10^{-2} \right) + 9 \right)^2 + 3 \right) - \left(\left(2 \left(1 - 10^{-2} \right) + 9 \right)^2 + 3 \right)}{2 \cdot 10^{-2}}$$
$$= \frac{\left(124.4404 - 123.5604 \right)}{2 \cdot 10^{-2}}$$

- Function: $\hat{y} = f(\mathbf{x}) = (2x_1 + 3x_2)^2 + 3$
- $f'(x) = \lim_{h \to 0} \frac{f(x + \frac{1}{2}h) f(x \frac{1}{2}h)}{h}$

• Evaluate $\frac{\partial}{\partial x_1} f \begin{pmatrix} 1 \\ 3 \end{pmatrix}$

Let's calculate it:

• Set h to $2 \cdot 10^{-2}$

$$\frac{\partial}{\partial x_1} f \begin{pmatrix} 1 \\ 3 \end{pmatrix} = \frac{\left(\left(2 \left(1 + 10^{-2} \right) + 9 \right)^2 + 3 \right) - \left(\left(2 \left(1 - 10^{-2} \right) + 9 \right)^2 + 3 \right)}{2 \cdot 10^{-2}}$$

$$= \frac{\left(124.4404 - 123.5604 \right)}{2 \cdot 10^{-2}}$$

$$= 43.9999$$

Finite Differences Summed up

- For practical use it often suffices to use $h = 1 \cdot 10^{-5}$
- For a more accurate derivative [7] use: $h = \epsilon_f^{\frac{1}{3}} \cdot x_c$
 - Where $\epsilon_f \approx 10^{-7}$
 - The characteristic scale is approximated as $x_c = x$
 - Prevent division by zero at x = 0

Conclusion

- Easy to use
- We only need to be able to evaluate functions
- Computationally inefficient
- Frequently used to check implementations

Analytic gradient

Example Problem

- Function: $\hat{y} = f(\mathbf{x}) = (2x_1 + 3x_2)^2 + 3$
- Evaluate $\frac{\partial}{\partial x_1} f \begin{pmatrix} 1 \\ 3 \end{pmatrix}$

Four analytic rules:

- 1. $\frac{d}{dx}$ const = 0
- 2. Linearity: $\frac{d}{dx}$ is a linear operator
- 3. Monomials: $\frac{d}{dx}x^n = n \cdot x^{n-1}$
- 4. Chain rule: $\frac{d}{dx}f(g(x)) = \frac{d}{dg}f(g)\frac{d}{dx}g(x)$

- Function: $\hat{y} = f(\mathbf{x}) = (2x_1 + 3x_2)^2 + 3$
- Evaluate $\frac{\partial}{\partial x_1} f \begin{pmatrix} 1 \\ 3 \end{pmatrix}$

1. $\frac{d}{dx}$ const = 0

- 2. $\frac{d}{dx}$ is linear
- $3. \ \frac{d}{dx}x^n = n \cdot x^{n-1}$
- 4. $\frac{d}{dx}f(g(x)) = \frac{d}{dg}f(g) \cdot \frac{d}{dx}g(x)$

Let's calculate it:

- Function: $\hat{y} = f(\mathbf{x}) = (2x_1 + 3x_2)^2 + 3$
- Evaluate $\frac{\partial}{\partial x_1} f \begin{pmatrix} 1 \\ 3 \end{pmatrix}$

1.
$$\frac{d}{dx}$$
const = 0

- 2. $\frac{d}{dx}$ is linear
- $3. \ \frac{d}{dx}x^n = n \cdot x^{n-1}$
- 4. $\frac{d}{dx}f(g(x)) = \frac{d}{dg}f(g) \cdot \frac{d}{dx}g(x)$

Let's calculate it:

$$\frac{\partial}{\partial x_1} f\begin{pmatrix} 1\\3 \end{pmatrix} = \frac{\partial}{\partial x_1} (2x_1 + 9)^2$$

Rules 1 and 2

- Function: $\hat{y} = f(\mathbf{x}) = (2x_1 + 3x_2)^2 + 3$
- Evaluate $\frac{\partial}{\partial x_1} f \begin{pmatrix} 1 \\ 3 \end{pmatrix}$

1.
$$\frac{d}{dx}$$
const = 0

- 2. $\frac{d}{dx}$ is linear
- 3. $\frac{d}{dx}x^n = n \cdot x^{n-1}$
- 4. $\frac{d}{dx}f(g(x)) = \frac{d}{dg}f(g)\cdot\frac{d}{dx}g(x)$

Let's calculate it:

$$\frac{\partial}{\partial x_1} f \begin{pmatrix} 1 \\ 3 \end{pmatrix} = \frac{\partial}{\partial x_1} (2x_1 + 9)^2$$
$$= \frac{\partial}{\partial z} (z)^2 \frac{\partial}{\partial x_1} (2x_1 + 9)$$

Rules 1 and 2

Rule 4 and
$$2x_1 + 9 = z$$

- Function: $\hat{y} = f(\mathbf{x}) = (2x_1 + 3x_2)^2 + 3$
- Evaluate $\frac{\partial}{\partial x_1} f \begin{pmatrix} 1 \\ 3 \end{pmatrix}$

1.
$$\frac{d}{dx}$$
const = 0

- 2. $\frac{d}{dx}$ is linear
- 3. $\frac{d}{dx}x^n = n \cdot x^{n-1}$
- 4. $\frac{d}{dx}f(g(x)) = \frac{d}{dg}f(g)\cdot\frac{d}{dx}g(x)$

Let's calculate it:

$$\frac{\partial}{\partial x_1} f \begin{pmatrix} 1 \\ 3 \end{pmatrix} = \frac{\partial}{\partial x_1} (2x_1 + 9)^2$$
$$= \frac{\partial}{\partial z} (z)^2 \frac{\partial}{\partial x_1} (2x_1 + 9)$$

$$=2(2x_1+9)\frac{\partial}{\partial x_1}(2x_1+9)$$
 Rule 3

Rules 1 and 2

- Function: $\hat{y} = f(\mathbf{x}) = (2x_1 + 3x_2)^2 + 3$
- Evaluate $\frac{\partial}{\partial x_1} f \begin{pmatrix} 1 \\ 3 \end{pmatrix}$

1.
$$\frac{d}{dx}$$
const = 0

- 2. $\frac{d}{dx}$ is linear
- $3. \ \frac{d}{dx}x^n = n \cdot x^{n-1}$
- 4. $\frac{d}{dx}f(g(x)) = \frac{d}{dg}f(g)\cdot \frac{d}{dx}g(x)$

Let's calculate it:

$$\frac{\partial}{\partial x_1} f \begin{pmatrix} 1 \\ 3 \end{pmatrix} = \frac{\partial}{\partial x_1} (2x_1 + 9)^2 \qquad \text{Rules 1 and 2}$$

$$= \frac{\partial}{\partial z} (z)^2 \frac{\partial}{\partial x_1} (2x_1 + 9) \qquad \text{Rule 4 and } 2x_1 + 9 = z$$

$$= 2(2x_1 + 9) \frac{\partial}{\partial x_1} (2x_1 + 9) \qquad \text{Rule 3}$$

$$= 2(2x_1 + 9) \cdot 2 = 44 \qquad \text{Rules 1 and 2 and } x_1 = 1$$

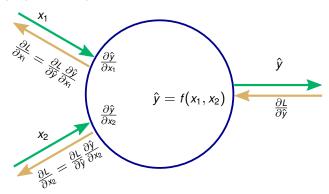

Analytic Gradient Summed up

- Chain rule and Linearity enable to decompose complex functions
- Analytic formulas have to be calculated manually
- Computationally more **efficient** than finite differences

Can we compute analytic gradients automatically?

Backpropagation Algorithm

- 1. Forward pass: Compute activations
- 2. Backward pass: Recursively apply chain rule

- Function: $\hat{y} = f(\mathbf{x}) = (2x_1 + 3x_2)^2 + 3$
- $\frac{d}{dx}f(g(x)) = \frac{d}{dg}f(g)\frac{d}{dx}g(x)$

• Evaluate $\frac{\partial}{\partial x_1} f \begin{pmatrix} 1 \\ 3 \end{pmatrix}$

$$x_1 = 1$$
 $a = x_1 \cdot 2$

$$c = a + b$$

$$e=c^2$$

$$g = e + 3$$

- Function: $\hat{y} = f(\mathbf{x}) = (2x_1 + 3x_2)^2 + 3$
- $\frac{d}{dx}f(g(x)) = \frac{d}{dg}f(g)\frac{d}{dx}g(x)$

$$x_1 = 1$$

$$a = x_1 \cdot 2$$

$$b = 9$$

$$x_2 = 3$$

$$b = x_2 \cdot 3$$

$$e=c^2$$

$$g = e + 3$$

- Function: $\hat{y} = f(\mathbf{x}) = (2x_1 + 3x_2)^2 + 3$
- $\frac{d}{dx}f(g(x)) = \frac{d}{dg}f(g)\frac{d}{dx}g(x)$

$$x_1 = 1$$

$$a = x_1 \cdot 2$$

$$b = 9$$

$$x_2 = 3$$

$$b = x_2 \cdot 3$$

$$a = 2$$

$$c = a + b$$

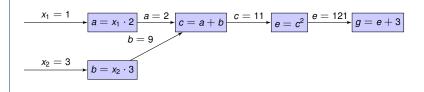

$$c = 11$$

$$e = c^2$$

$$g=e+3$$

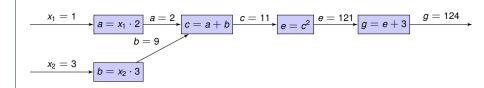

- Function: $\hat{y} = f(\mathbf{x}) = (2x_1 + 3x_2)^2 + 3$
- $\frac{d}{dx}f(g(x)) = \frac{d}{dg}f(g)\frac{d}{dx}g(x)$

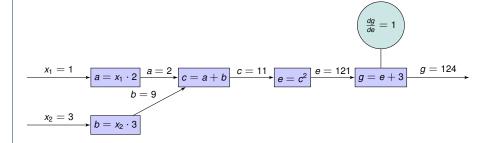

- Function: $\hat{y} = f(\mathbf{x}) = (2x_1 + 3x_2)^2 + 3$
- $\frac{d}{dx}f(g(x)) = \frac{d}{dg}f(g)\frac{d}{dx}g(x)$

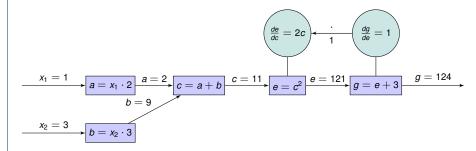

- Function: $\hat{y} = f(\mathbf{x}) = (2x_1 + 3x_2)^2 + 3$
- $\frac{d}{dx}f(g(x)) = \frac{d}{dg}f(g)\frac{d}{dx}g(x)$

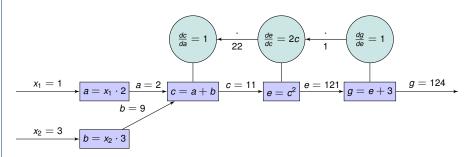

- Function: $\hat{y} = f(\mathbf{x}) = (2x_1 + 3x_2)^2 + 3$
- $\frac{d}{dx}f(g(x)) = \frac{d}{dg}f(g)\frac{d}{dx}g(x)$

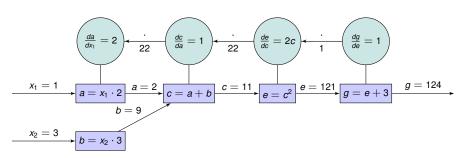

- Function: $\hat{y} = f(\mathbf{x}) = (2x_1 + 3x_2)^2 + 3$
- $\frac{d}{dx}f(g(x)) = \frac{d}{dg}f(g)\frac{d}{dx}g(x)$

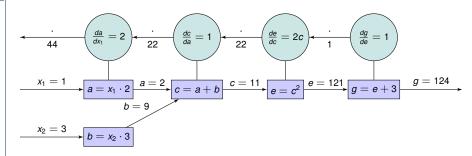

- Function: $\hat{y} = f(\mathbf{x}) = (2x_1 + 3x_2)^2 + 3$
- $\frac{d}{dx}f(g(x)) = \frac{d}{dg}f(g)\frac{d}{dx}g(x)$

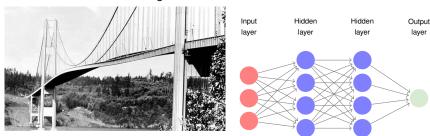

- Function: $\hat{y} = f(\mathbf{x}) = (2x_1 + 3x_2)^2 + 3$
- $\frac{d}{dx}f(g(x)) = \frac{d}{dg}f(g)\frac{d}{dx}g(x)$

Stability Problem

• What do those two images have in common?

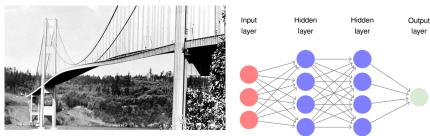

Click for video

Stability Problem

What do those two images have in common?

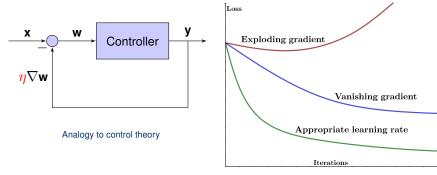

Click for video

- Both suffer from positive feedback!
- This can cause disaster

Feedback loop

- If η is too high \rightarrow positive feedback \rightarrow loss grows without bounds
- If η is too small \rightarrow negative feedback \rightarrow gradient vanishes
- Choice of η is **critical** for learning

Backpropagation Summed up

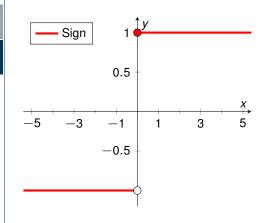

- Built around the chain rule
- Uses a forward-pass through the function
- Computationally very **efficient** by using a **dynamic programming** approach
- Is no training algorithm, because it just computes a gradient

Consequences

- Product of partials → numerical errors multiply
- Product of partials → vanishing or exploding gradient

About the sign Activation Function

Sign

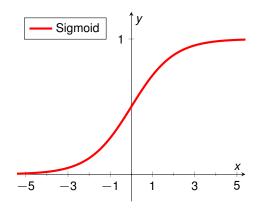

$$f(x) = \begin{cases} +1 & \text{for } x \ge 0 \\ -1 & \text{for } x < 0 \end{cases}$$

$$f'(x)=2\delta(x)$$

- + Normalized output
- Gradient vanishes almost everywhere!

Smooth Activation Function

Sigmoid (logistic function)

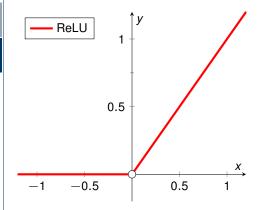

$$f(x) = \frac{1}{1 + exp(-x)}$$

 $f'(x) = f(x)(1 - f(x))$

- Normalized output
- Gradient still eventually vanishes

Piecewise-linear Activation Function

Rectified Linear Unit (ReLU)

$$f(x) = \max(0, x)$$

$$f'(x) = \begin{cases} 1 & \text{if } x > 0 \\ 0 & \text{else} \end{cases}$$

+ Less vanishing gradient

Layer Abstraction

From Graphs of Nodes to Graphs of Layers

- We introduced lavers but computed everything on individual nodes
- It is convenient to add further abstraction
- But how can we express this?

Recall: Single neuron

- Add a bias unit to $\mathbf{x} \in \mathbb{R}^{N-1}$ by adding a dimension with $x_n = 1$
- This is a connection from every input element to the single output element:

$$\hat{y} = \mathbf{w}^T \mathbf{x}$$

Representing the connections

• Assume we have M neurons $\to M$ sets of weights: \mathbf{w}_m for $m \in \{1, \dots, M\}$

$$\hat{y_m} = \mathbf{w}_m^T \mathbf{x}$$

We rewrite this operation as matrix-vector multiplication:

$$\hat{\mathbf{y}} = \mathbf{W}\mathbf{x}$$

- This is known as fully connected layer.
- It represents any arbitrary connection topology between layers.
- We can describe back-propagation in this more abstract view as well!

Fully Connected Layer

$$\begin{pmatrix} \hat{y}_1 \\ \hat{y}_2 \end{pmatrix} = \begin{bmatrix} w_{11} & w_{12} & w_{13} \\ w_{21} & w_{22} & w_{23} \end{bmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix}$$

The forward-pass is:

$$\hat{\mathbf{y}} = \mathbf{W}\mathbf{x}$$

- After the forward-pass through all layers, we can compute a loss that depends on our loss function L.
- We need two gradients for the backward-pass:
 - Gradient with respect to the weights: $\frac{\partial L}{\partial w}$ for gradient descend
 - Gradient with respect to the inputs: $\frac{\partial L}{\partial x}$ for backpropagation

Fully Connected Layer Summed up

- Can represent any connection topology
- Enables higher level view concentrating on layers instead of nodes
- Is a matrix multiplication:

$$\hat{\mathbf{y}} = \mathbf{W}\mathbf{x}$$

Its gradient with respect to the weights:

$$\frac{\partial L}{\partial \mathbf{W}} = \frac{\partial L}{\partial \hat{\mathbf{y}}} \frac{\partial \hat{\mathbf{y}}}{\partial \mathbf{W}} = \frac{\partial L}{\partial \hat{\mathbf{y}}} \mathbf{x}^T$$

Its gradient with respect to the input:

$$\frac{\partial L}{\partial \mathbf{x}} = \frac{\partial L}{\partial \hat{\mathbf{y}}} \frac{\partial \hat{\mathbf{y}}}{\partial \mathbf{x}} = \mathbf{W}^T \frac{\partial L}{\partial \hat{\mathbf{y}}}$$

Fully Connected Layer: Simple example

 Assume we are looking at a simple network (no activation function) with the forward pass:

$$\hat{\mathbf{y}} = \mathbf{W}\mathbf{x}$$

We try to find parameters W that minimize the following loss function:

$$L(\mathbf{x}, \mathbf{W}, \mathbf{y}) = \frac{1}{2} \|\mathbf{W}\mathbf{x} - \mathbf{y}\|_2^2$$

- Then simply: $\frac{\partial L}{\partial \hat{\mathbf{y}}} = \hat{\mathbf{y}} \mathbf{y} = \mathbf{W}\mathbf{x} \mathbf{y}$
- The gradient with respect to the weights: $\frac{\partial L}{\partial \mathbf{w}} = (\mathbf{W}\mathbf{x} \mathbf{y})\mathbf{x}^T$
- The gradient with respect to the inputs: $\frac{\partial L}{\partial \mathbf{x}} = \mathbf{W}^T(\mathbf{W}\mathbf{x} \mathbf{y})$

· Let's add some layers

$$\hat{\boldsymbol{y}} = \hat{\boldsymbol{f}}_3(\hat{\boldsymbol{f}}_2(\hat{\boldsymbol{f}}_1(\boldsymbol{x})))) = \boldsymbol{W}_3\boldsymbol{W}_2\boldsymbol{W}_1\boldsymbol{x}$$

April 24, 2023

Summary

- Softmax activation function with cross entropy loss mostly go together as "Softmax Loss".
- Gradient descent is our default training algorithm in deep learning.
- We can compute gradients using finite differences to check our implementation.
- We use the backpropagation algorithm to compute gradients efficiently.
- The fully connected layer is the most general connectivity between layers in a feed-forward neural network.

NEXT TIME

ON DEEP LEARNING

- Problem adapted loss functions
- Sophisticated optimization routines
- Optimization adapted to the needs of every single parameter
- An argument why neural networks shouldn't perform well
- Some very recent insights why they do perform well

Comprehensive Questions

- Name a loss function for multi-class classification in deep learning.
- Explain how this loss function works.
- How can you check if the derivative implementation of a loss function is correct?
- What does backpropagation do?
- How does backpropagation work?
- Explain the exploding and vanishing gradient problems.
- Why is the signum function not used in deep learning?
